MTF-RMS CONCEPT

MTF-RMS: the system of the systems

- Any NPP is fully equipped with many monitoring equipments
 - The systems dedicated to monitor radiations have continuously grown in number and complexity
- The main goal of radiological protection is to reduce the personal exposure levels
 - For a proper optimization the information quality and quantity is critical
- To take full advantage of all data provided by these monitors (over 100 channels for each unit), it is a must to view and consolidate all inputs into one central system.
 - Storage of data
 - Possibility of trend studies of the data
 - Set/modify acquisition parameters
 - Possible correlation between parameters
- Make all systems belonging to various generations, technologies and/or manufacturers to work together

The answer: MTF-RMS (MaTe-Fin Radiological Monitoring System)

MTF-RMS

Short History

• Generation I

- For the first time in 2005, all data from various radiation monitoring systems are put together.
- MTF-RMS generation I was built around the Ramvision software developed by MGP Instruments.
- MATE-FIN has also developed custom software for TAM, C&C monitors and portable monitors.
- There were separate servers for data collection and storage.
- Data were visualized via software clients, inside the local network.

• Generation II

- The generation II is using the newest IT technologies, like industrial Ethernet, fiber-optic, virtual machine, etc.
- There is one central data-base with modern data management: detailed reports, data visualization, trends, etc.
- The system is redundant and flexible
- There is an unlimited number of clients through the web interface (JSON / WCF Webservice) accessible all over Intranet

MTF-RMS First Generation

Cernavoda NPP Unit 2

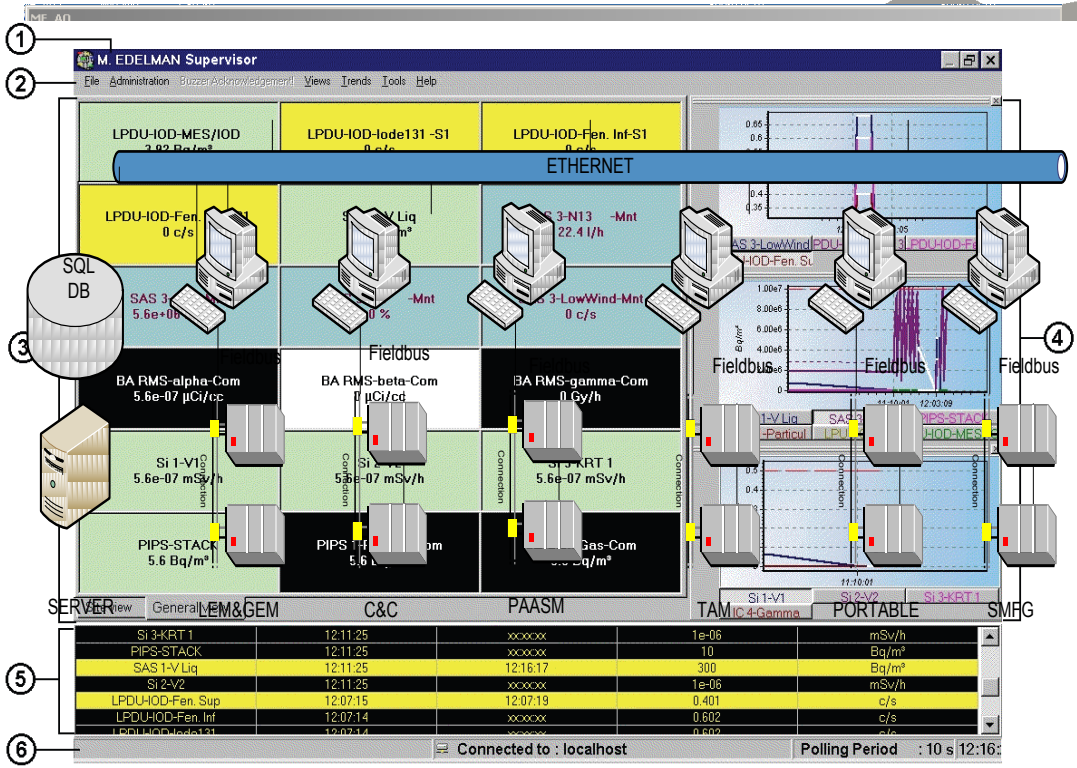

MF-AO manages information from Overhoff Tritium Monitors. The first attempt to monitor on-line the H3 and integrate into a RMS system.

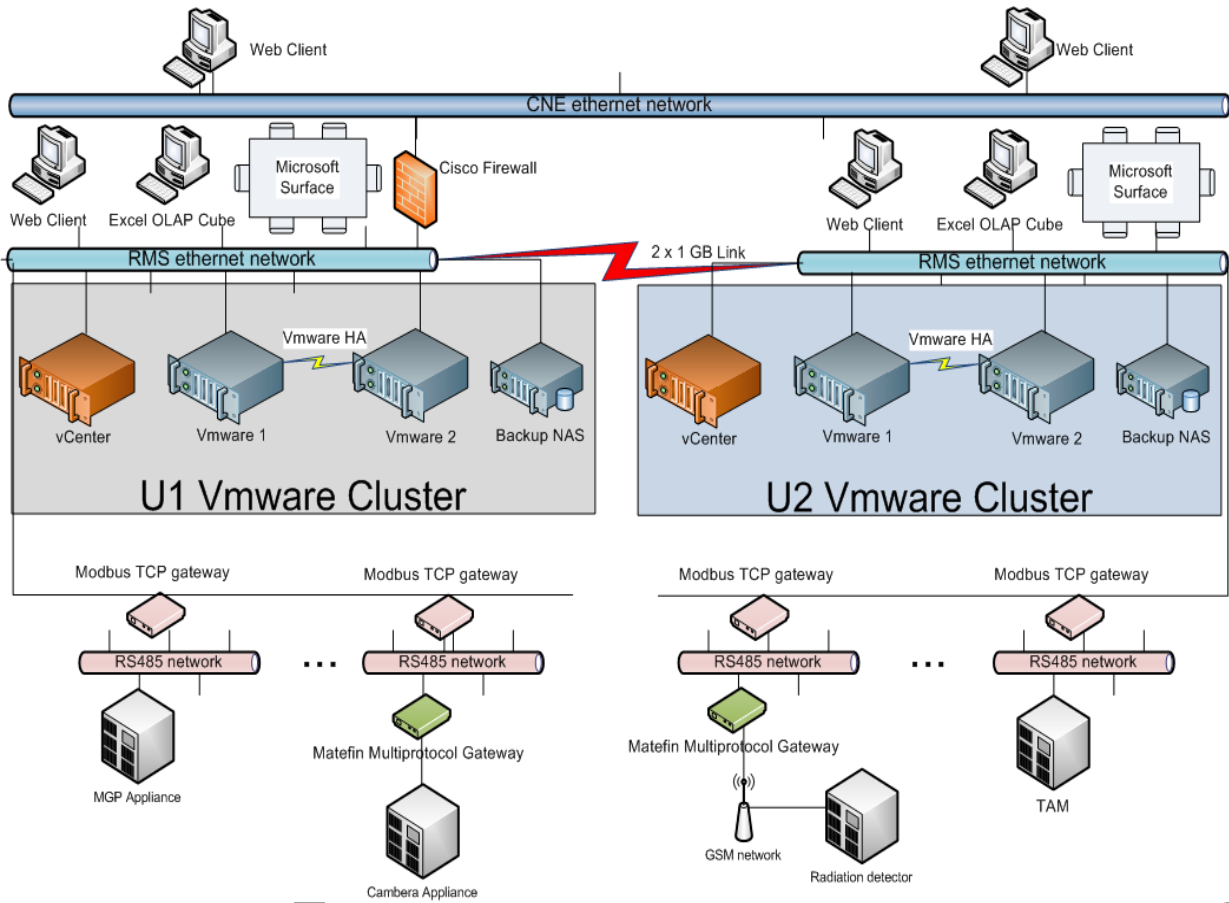

MF-AR manages information from all Contamination Monitors

The system is on service from 2006, based on MGP software RAMVISION and in-house software merge and MF_AR information from all MGP specific systems

The main components of the MTF-RMS for NPP Cernavoda Unit 2 are 7 computers linked into a LAN. They are responsible for making the link with fibribuses with different systems scattered all over the site. There is a central SQL DB server who stores the data.

MTF-RMS - Second Generation

The second generation network environment is a 100% client-server application. Virtualized IT environment is a 100% client-server application.

The architecture is divided into 3 main components:

- The acquisitions tasks are distributed to specific hardware TCP/Fieldbus gateways and all protocols are converted to TCP/MODBUS protocol.
- The data processing servers like SQL, OPC, Backup or WEB, and the application software itself, are located on different VM.
- The clients can be any computer with IE and Excel to view data and generate reports. Optional, different interfaces are available.

AAGM

Gamma Area Monitors

- AAGM, with its 35 channels, provides real-time measurements of Gamma levels (reactor building and the service building)
- Channels installed inside the reactor building have ionization chambers and Si detectors with special mineral cables, allowing to operate in high gamma and neutron fields for at least 30 years
- MGP Instruments (part of MIRION Group, France) equipment
- Unit 1: all original equipment was replaced after 15 years of operation (MATE-FIN)
- Unit 2 reactor building: channels upgraded (MATE-FIN)
- AAGM both in unit 1 and 2 are under full maintenance by MATE-FIN.

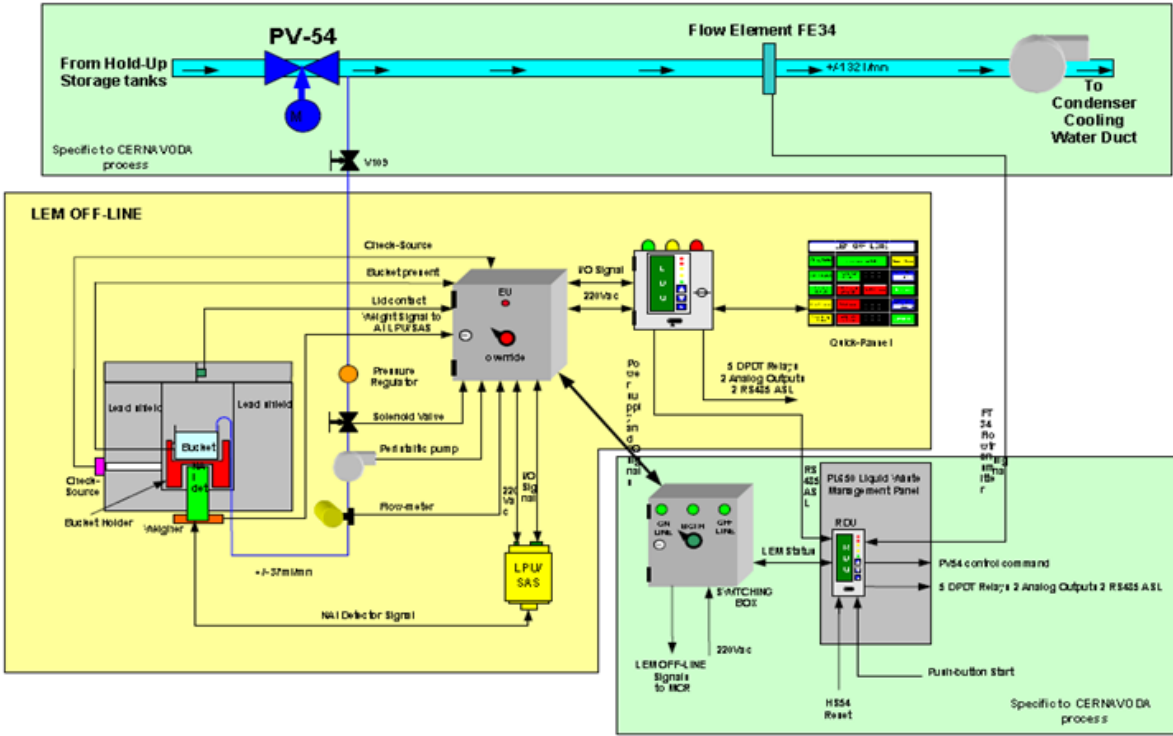

Channel	Acquisition interface	Unit
AL DR	MTF-Gateway RS-485	mSV/h
Dose Rate	MTF-Gateway RS-485	mSV/h
Door	MTF-Gateway RS-485	N/A
LowCps	MTF-Gateway RS-485	c/s
HighCps	MTF-Gateway RS-485	c/s
Temp	MTF-Gateway RS-485	Deg.C
TID	MTF-Gateway RS-485	mSv
Dose	MTF-Gateway RS-485	mSv
DoseR1	MTF-Gateway RS-485	mSv/h

LEM Liquid Effluent Monitor

Critical system, redundant configuration

There are two independent systems made by MGP Instruments, which drive the valve PV54 responsible for liquid discharge. Thanks to that configuration, we get a zero time for maintenance.

LEM Liquid Effluent Monitor

Channel	Aquisition interface	Unit
LEM ONLINE		
LiqAct	MTF Gateway RS-485	Bq/ml
Discharg	MTF Gateway RS-485	l/h
CS137CPS	MTF Gateway RS-485	c/s
GrosWin1	MTF Gateway RS-485	c/s
GrosWin2	MTF Gateway RS-485	c/s
Temp	MTF Gateway RS-485	°C
DO1	MTF Gateway RS-485	N/A
LEM OFFLINE		
BkgAct	MTF Gateway RS-485	Bq/ml
Discharg	MTF Gateway RS-485	l/min
VolAct	MTF Gateway RS-485	Bq/ml
Cs137Cps	MTF Gateway RS-485	c/s
Win1Cps	MTF Gateway RS-485	c/s
Win2Cps	MTF Gateway RS-485	c/s
Temp	MTF Gateway RS-485	°C

GEM

Gaseous Effluent Monitor - Critical system

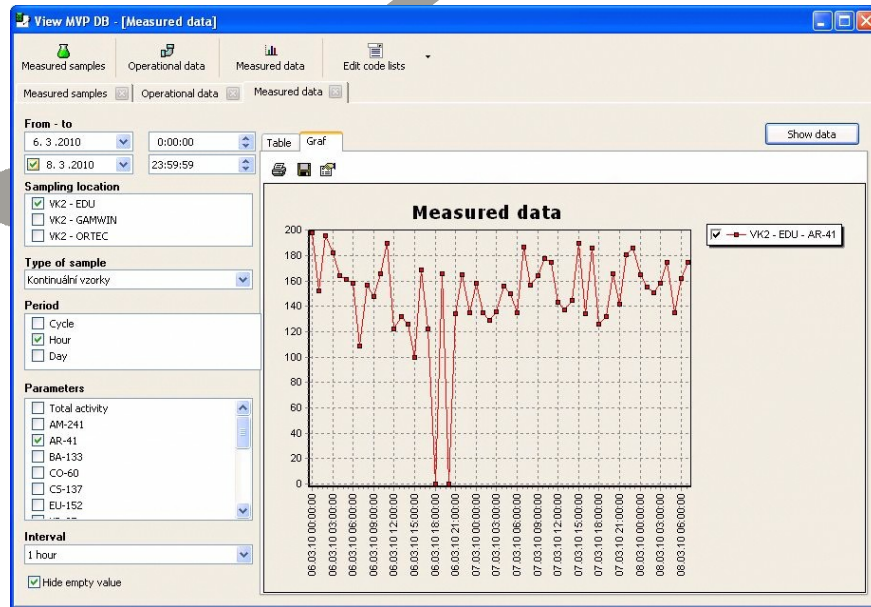

Monitors the stack gases, using isokinetic sampling, by:

- ABPM - Particulate Monitor
 - 16 acquisition channel
- IM - Iodine Monitor
 - 13 acquisition channel
- NGM - Noble Gas Monitor
 - 17 acquisition channel
- Passive samplers for H3 and C14

GEM Spec

Additionally, the noble gases release is monitored on-line for ten different isotopes, by Gamma spectrometry. All history and spectra are stored into an Oracle SQL DB. Many analysis and reports are available
10 acquisition channel

PAASM

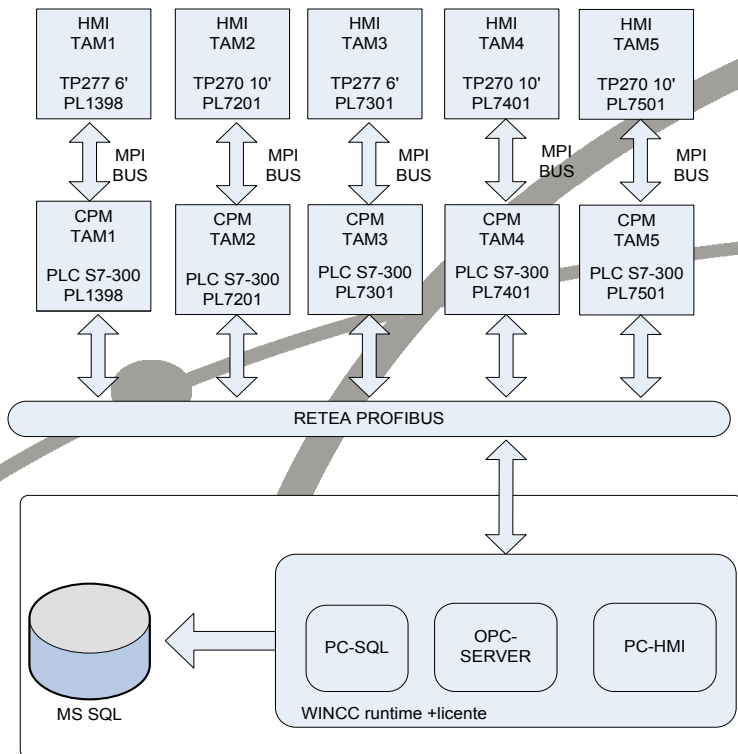

Post Accident Air Sampling Monitor

- IM-Iodine Monitor
 - 7 acquisition channel
- NGM-HR
 - 9 acquisition channel
- NGM-LR
 - 7 acquisition channel
- H3 Sampler

TAM - Tritium in air monitor

Architecture overview

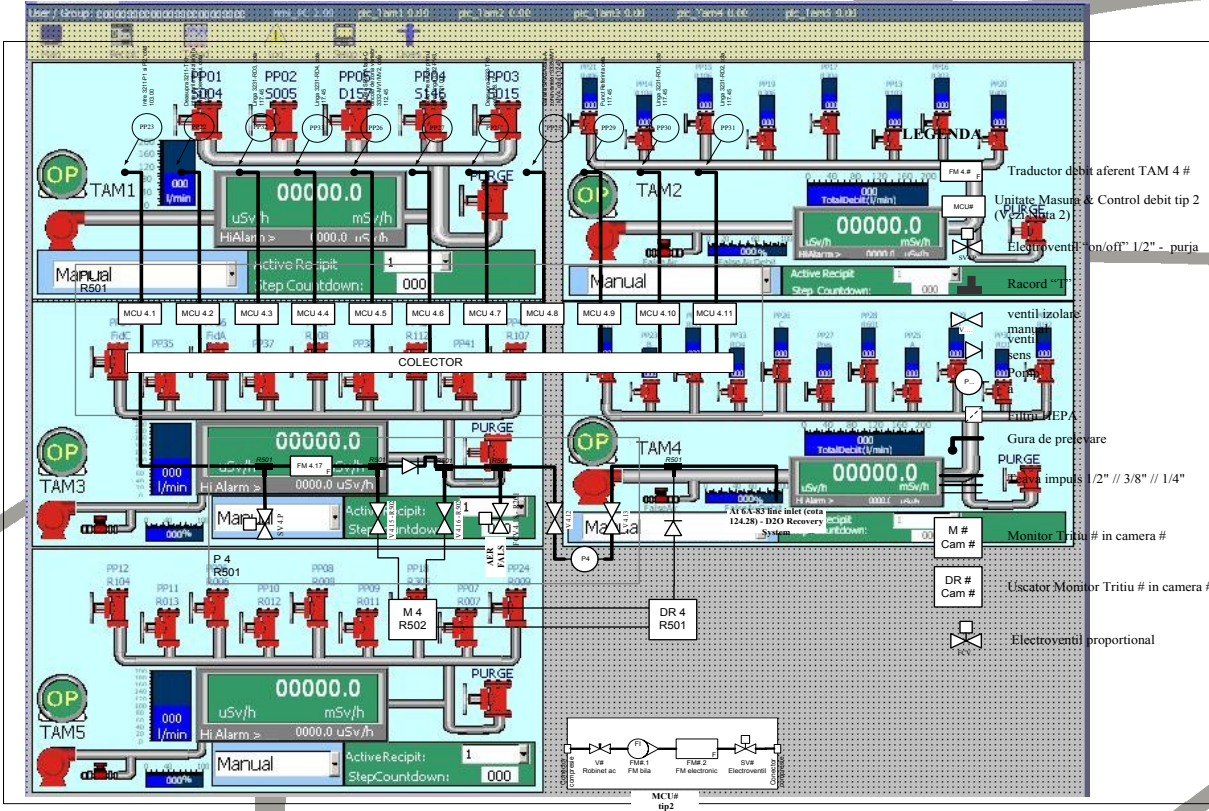

The latest generation of TAM is working at Cernavoda NPP Unit1 since 2010.

- New concept, using the power of PLC to optimize the sampling process.
- All information are available using a HMI interface, locally and remote.
- six hour memory buffer for each monitor to save the measurements in case of SQL server malfunction.

TAM

Tritium in Air Monitors

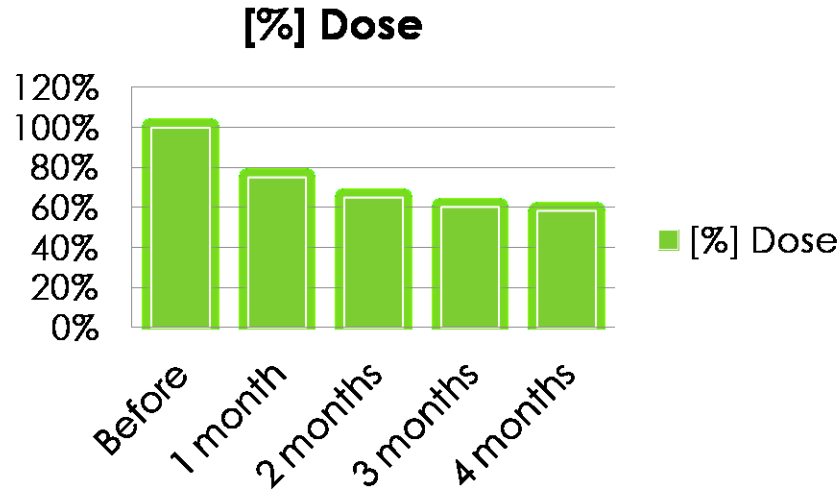

- TAM is a MATE-FIN design
- Overhoff 357 H3 monitors
 - custom sampling system based on PLC technology.
 - Over forty locations (reactor building and service building)
 - U1 – 5 monitors, 42 sampling location
 - U2 – 8 monitors, 32 sampling location
 - Complex scanning algorithms
 - the system is able to locate very quickly any leak of heavy water.

Screenshot example of sampling system

TAM benefits

Tritium doses have decreased significantly

- After the TAM has become operational, the personnel Tritium doses have decreased significantly.
 - There is no need anymore to deploy personnel for manual measurement of Tritium levels.
- Data provided by TAM are used to optimize the functioning of dryers in the ventilation system.

C&C

Contamination and clearance monitors

- hand and foot monitors installed inside the power-plant, at the cross-border of zone 1 and zone 2,
- total body contamination monitors installed at the exit of zone 2.

(RADOS Technologies Finland, part of MIRION group)

Channel	Interfata Achizitie	Unit
Normal operation/failure	MTF-Gateway DI	N/A
Contamination	MTF-Gateway DI	N/A
Measurement under contamination level	MTF-Gateway DI	N/A

Portable

Portable and mobile monitors

- MTF-RMS has also the possibility to connect with mobile monitors (gamma, neutron, tritium, particulate, etc.)
- Portable monitors are connected to MTF-RMS via sockets installed inside the power-plant, and the data are collected, displayed and stored by the central system
- Automatic identification of instrument type and location

CEAS

Continuous Environmental Air Samplers

- 12 sampling stations installed around the power-plant for continuous sampling of environmental air for off-line measurement of Tritium, Iodine and radioactive particles

- 19 acquisition channel

(F&J Specialty Products USA, integrated by MATE-FIN)

MTF-MOBCAR

Radiological Emergency Lab

Mobile radiological laboratory, integrated into the MTF-RMS, equipped with:

- ABPM - Particle Monitor
- IM - Iodine Monitor
- Gamma monitor
- Weather Station
- GPS System

All information are remotely stored in a database server for later reporting and analyze.

MF-ADMIR - local software that collects and sends all information to the SQL server

The screenshot displays the MF-ADMIR software interface. The title bar reads 'MF_ADMIR'. The interface is divided into several sections:

- IM-201 Section:** Contains input fields for 'I131-ACT [Bq/m3]', 'I131-Cps [c/s]', 'Volume [L]', and 'Temp [grd]'. There are also partially visible fields for 'R' and 'Tem'.
- Clima Section:** Contains input fields for 'Wind speed [M/S]', 'Wind dir [grd]', 'Temp [grd]', 'Humidity [%]', and 'Pressure [mB]'.
- GPS Section:** Contains input fields for 'Latitude', 'Longitude', 'Altitude', and 'GPS Time'.
- System Settings Section:** Lists 'CLIMA=COM6', 'GPS=COM5', 'THERMO=COM5', 'MGP=localhost:2000', 'SQL1=localhost', and 'SQL2=null'. Below this is a 'Send Data' button.
- Messages List Section:** A large empty text area for displaying messages.
- Navigation Buttons:** 'About' and 'Exit' buttons are located at the bottom right.

The background image shows the MTF-MOBCAR vehicle, a white van with a license plate 'T.1.1997', equipped with a radiation detection system on its roof.

Open Door

MTF-RMS: the system of the systems

And finally, probably the most important of the systems: "The Open Door"

Based on open standards like Profibus, Profinet, Modbus, OPC and SQL server, MTF-RMS keeps the door open for future systems and, even more, for the future systems of Units 3 and 4.

Personal dosimetry

Personal Dosimetry and Teledosimetry

- This system measures and records the Gamma dose for each worker entering the radiological area. The system consists, for each unit, of 200 Personal Alarming Dosimeters (PAD), together with 6 readers. All data, from all units, are collected by one central database server
- Dosimetry and teledosimetry systems in Cernavoda NPP were provided by MATE-FIN, using equipment manufactured by MGP Instruments France, part of MIRION group.
- Dosimetry systems are maintained by MATE-FIN under maintenance contract signed with Cernavoda NPP
